

Flashcard study app

Tap. Flip. Swipe.

A focused iPhone 16 Pro Max study experience. Select a deck and the flashcard becomes almost the entire screen. Tap to reveal the back, swipe left to keep the card in the loop, and swipe right to remove it from the active loop.

- Full-screen card
- Tap to flip
- Left = loop
- Right = remove

01

Select deck

One tap enters study mode immediately.

02

Tap to flip

No visible flip button. The card itself is the control.

03

Swipe to sort

Left repeats. Right removes from the current loop.

Updated core interaction model

The app is intentionally stripped down. After a deck is selected, the user interacts with one large card surface and two swipe directions only.

Deck library entry screen

The deck list stays simple. Tapping a deck opens the first card immediately; no extra intermediate detail page is needed.

Whole-tile tap target

The entire deck tile acts as one touch target. This keeps entry fast and clean.

Fast transition

Tap a deck → open the card view immediately, already in full-screen study mode.

Quiet information hierarchy

Deck name is primary. Card count and review progress are secondary supporting details.

Front side - full-screen flashcard

On iPhone 16 Pro Max, the flashcard fills almost the entire screen. No action buttons are shown. The count sits quietly near the bottom as an overlay.

One object, one focus

The full-screen card is the experience. Everything unrelated to learning is visually removed.

Tap anywhere

A tap on the card flips it over. The user does not need a dedicated flip button.

No distractions

Do not show next, previous, flip, or CTA buttons on this screen. Only the card content and the small progress count should remain.

Back side - revealed answer

The same card stays in the same location. Only its face changes. This keeps the front and back mentally connected as one physical card.

Same surface

The back side is not a new page. It is the reverse face of the same card.

Next action is swipe

After the user sees the answer, the decision is directional: swipe left to keep practicing, swipe right to remove from the repeating loop.

Tap again if needed

The user can tap the card again to flip back to the front before making the left/right decision.

Swipe behavior and looping logic

Left and right swipes are not just navigation. They control whether a card remains inside the active study loop.

Swipe left = keep in loop

Looping

When the user swipes **left**, the current card leaves to the left and goes to the back of the queue.

Continuous left swipes create an endless loop: **A → B → C → A → B → C ...**

Swipe right = remove from loop

Session removal

When the user swipes **right**, the current card is removed from the active loop and should not appear again during the current cycle.

Example sequence:

- Start with active deck: **A, B, C**
- Swipe left on **A** → queue becomes **B, C, A**
- Swipe left on **B** → queue becomes **C, A, B**
- Swipe right on **C** → **C is removed**, active queue becomes **A, B**
- If the user keeps swiping left now, the loop becomes **A → B → A → B ...**

This is ideal for study sorting: cards you still need stay in the loop, cards you are done with disappear from that loop.

Design rules, behavior rules, and acceptance criteria

This final specification summarizes the updated product behavior requested for the prototype PDF.

Visual rules

- Phone target: **iPhone 16 Pro Max**.
- Flashcard surface takes almost the full screen.
- Only a tiny count such as **12 / 40** appears near the lower bottom as an overlay.
- No extra on-screen buttons or distracting controls in study mode.

Interaction rules

- **Tap card** = flip front/back.
- **Swipe left** = keep card in active loop and send it to the back.
- **Swipe right** = remove card from the active repeating loop.
- If only A and B remain, repeated left swipes cycle **A → B → A → B**.

Motion rules

- Flip animation should feel like one physical card turning over.
- Left swipe should visually fade/slide the card out to the left.
- Right swipe should clearly communicate dismissal/removal from the loop.
- Animations should stay quick and lightweight for repeated study.

Acceptance criteria

- Deck tap opens study mode immediately.
- User can study without visible action buttons.
- Front and back are reachable only by tapping the card.
- Loop/removal logic matches the A/B/C examples described above.

Product intent

The experience should feel almost frictionless: open deck, focus on one card, tap to reveal, and use simple directional swipes to control repetition. The UI should disappear as much as possible so the study behavior becomes natural and fast.
